

IT LOOKED VERY PROMISING FOR DICKIE, BUT IT DIDN'T PAN OUT.

IN THE SOUTHWEST**

Items of Interest in the Mining Camps Throughout Arizona and New Mexico; Development and Production.

## Arizona

A new kind of ore has been made on the property of the Economic Mining & Milling Co., eight miles southwest of here. The ore body has been uncovered for 2200 feet. The find is on a new claim which adjoins the company property on the north. A small amount of surface work has revealed an immense body of ore, that through assay shows copper carbates and the average value is estimated at \$10.

## Organito

A shaft about 50 feet deep is being opened up on the old Excelior property by W. H. Bates, and a good quantity of ore is showing. The vein shows 70 feet wide and the foot wall has not yet been encountered. Assays of from \$1 to \$75.50 have been obtained. There are several claims in the group and the vein opened up is but one of a number which cross the property. The property carries this vein for 3,000 or 4,000 feet and there are prominent couplings at other points.

## Mogollon

The Treasure Mining & Reduction Co. is mining 60 tons of ore a day which is milled in the mill. All the machinery in both mine and mill is operated by electricity generated by water power on Whitewater creek. A wire rope tramway is to be installed from the mine to the mill.

Development work is being done in the Little Charlie camp by the Mogollon Gold & Copper Co. in a high grade of mill run from the property. The project carries this vein for 3,000 or 4,000 feet and there are prominent couplings at other points.

## Gallion

The Treasure Mining & Reduction Co. is mining 60 tons of ore a day which is milled in the mill. All the machinery in both mine and mill is operated by electricity generated by water power on Whitewater creek. A wire rope tramway is to be installed from the mine to the mill.

## Lordsburg

The shutting down of the Eighty Five company's plant near Lordsburg because of the emptiness of the company's oil tank has made no difference in the ore shipments. There are several claims in the group and the vein opened up is but one of a number which cross the property. The property carries this vein for 3,000 or 4,000 feet and there are prominent couplings at other points.

## Jicarilla

A. H. Norton has uncovered a rich vein of ore in the Good Luck tunnel at Jicarilla. The vein is gradually getting wider. C. C. Hedges has put a small force at work on the Doctor claim at Jicarilla. The outlook is for a larger yield and better grade of ore on the Gold Stake at Jicarilla as the miners will prove great producers.

Hedges is putting a report made by P. L. Griffin, an oil expert, in response to a request of the Yuma Commercial club, one of the most progressive business organization in the territory.

## Gallion

Rodolfo Ortega, a McKinley county cattle trader, came into town with samples of a substance of a very greasy nature that is believed to be a good oil bearing material.

This substance has been discovered in the range about 20 miles north of Grants at a place called El Puerto de Flores. He came to Gallup to record findings for a party on two sections of the land. The substance was discovered floating up through the crevices in the rocks.

REPUBLICANS ARE  
UNITED IN CLAYTON

Let us republicans nominate the best men we have in our party to fill the positions of honor in our new state. Let the people rule. King politics will never win in the long run. Let us start right, and victory will be ours.

## If we win in the coming campaign for supremacy in Union county and New Mexico we must be united and give everyone a square deal. The Spanish-American and Anglo-Saxon republicans by pulling together can win the battle. "United we stand, divided we fall."--Clayton Citizen.

"Using the Verde river as a division line, the formation changes from an igneous one on the west to a sedimentary formation on the east, and a sedimentary formation is the best requisite for an oil field."

"This formation consists of large measures of sandstone, lime and shale being also the usual formations encountered in any oil field. The tertiary formation in which the oil measures of California are found are here entirely eroded away and are older formation, the cretaceous, is exposed to view. In this you may expect to develop a grade of refining oil much superior to the California product."

"The age then geologically of the formation to the east of the Verde river is favorable for oil, and the quality should be good."
